

CS61B Lecture #4: Simple Pointer Manipulation

Recreation Prove that for every acute angle $\alpha > 0$,

$$\tan \alpha + \cot \alpha \geq 2$$

Announcements

- **Today:** More pointer hacking.
- **Handing in labs and homework:** We'll be lenient about accepting late homework and labs for lab1, lab2, and hw0. Just get it done: part of the point is getting to understand the tools involved. We will **not** accept submissions by email.
- We will feel free to interpret the absence of a central repository for you or a lack of a lab1 submission from you as indicating that you intend to drop the course.
- HW1 to be released tonight (roughly).
- Project 0 to be released Friday.

CS61B: Lecture #4 1

Small Test of Understanding

- In Java, the keyword **final** in a variable declaration means that the variable's value may not be changed after the variable is initialized.
- Is the following class valid?

```
public class Issue {  
  
    private final IntList aList = new IntList(0, null);  
  
    public void modify(int k) {  
        this.aList.head = k;  
    }  
}
```

Why or why not?

Last modified: Mon Feb 3 16:54:41 2020

CS61B: Lecture #4 2

Small Test of Understanding

- In Java, the keyword **final** in a variable declaration means that the variable's value may not be changed after the variable is initialized.
- Is the following class valid?

```
public class Issue {  
  
    private final IntList aList = new IntList(0, null);  
  
    public void modify(int k) {  
        this.aList.head = k;  
    }  
}
```

Why or why not?

Answer: This is **valid**. Although `modify` changes the head variable of the object pointed to by `aList`, it does **not** modify the contents of `aList` itself (which is a pointer).

CS61B: Lecture #4 3

Destructive Incrementing

Destructive solutions may modify objects in the original list to save time or space:

```
/** Destructively add N to P's items. */  
static IntList dincrList(IntList P, int n) {  
    if (P == null)  
        return null;  
    else {  
        P.head += n;  
        P.tail = dincrList(P.tail, n);  
        return P;  
    }  
}  
  
/** Destructively add N to L's items. */  
static IntList dincrList(IntList L, int n)  
{  
    // 'for' can do more than count!  
    for (IntList p = L; p != null; p = p.tail)  
        p.head += n;  
    return L;  
}
```

Aside: How to Write a Loop (in Theory)

- Try to give a description of how things look on *any arbitrary iteration* of the loop.
- This description is known as a *loop invariant*, because it is always true at the start of each iteration.
- The loop body then must
 - Start from any situation consistent with the invariant and condition;
 - Make progress in such a way as to make the invariant true again.

```

// Invariant must be true here
while (condition) { // condition must not have side-effects.
    // (Invariant and condition are necessarily true here.)
    loop body
    // Invariant must again be true here
}
// Invariant true and condition false.

```
- So if our loop gets the desired answer whenever *Invariant* is true and *condition* false, our job is done!

CS61B: Lecture #4 45

Relationship to Recursion

- Another way to see this is to consider an equivalent recursive procedure:

```

/** Assuming Invariant, produce a situation where Invariant
 * is true and condition is false. */
void loop() {
    // Invariant assumed true here.
    if (condition) {
        // Invariant and condition true here.
        loop body
        // Invariant must be true here.
        loop()
        // Invariant true here and condition false.
    } else { /* condition false here. */ }
}

```

- Here, the invariant is the precondition of the function *loop*.
- The loop maintains the invariant while making the condition false.
- Idea is to arrange that our actual goal is implied by this post-condition.

Example: Loop Invariant for dremoveAll

```

/** The list resulting from removing all X's from L
 * destructively. */
static IntList dremoveAll(IntList L, int x) {
    IntList result, last;
    result = last = null;
    while ** (L != null) {
        IntList next = L.tail;
        if (x != L.head) {
            if (last == null)
                result = last = L;
            else
                last = last.tail = L;
            L.tail = null;
        }
        L = next;
    }
    return result;
}

```

**** Invariant:**

- result points to the list of items in the final result except for those from L onward.
- L points to an unchanged tail of the original list of items in L.
- last points to the last item in result or is null if result is null.
