

## CS61B Lectures #29

### Today:

- Lower bounds on sorting by comparison
- Distribution counting, radix sorts

**Readings:** Today: *DS(IJ)*, Chapter 8; Next topic: Chapter 9.

Last modified: Tue Jan 21 15:10:54 2020

CS61B: Lecture #29 1

## Better than $N \lg N$ ?

- Can prove that *if all you can do to keys is compare them*, then sorting must take  $\Omega(N \lg N)$ .
- Basic idea: there are  $N!$  possible ways the input data could be scrambled.
- Therefore, your program must be prepared to do  $N!$  different combinations of data-moving operations.
- Therefore, there must be  $N!$  possible combinations of outcomes of all the if-tests in your program, since those determine what move gets moved where (we're assuming that comparisons are 2-way).

Decision Tree  
Height  $\propto$  Sorting time

Last modified: Tue Jan 21 15:10:54 2020

CS61B: Lecture #29 2

## Necessary Choices

- Since each if-test goes two ways, number of possible different outcomes for  $k$  if-tests is  $2^k$ .
- Thus, need enough tests so that  $2^k \geq N!$ , which means  $k \in \Omega(\lg N!)$ .
- Using Stirling's approximation,

$$N! \in \sqrt{2\pi N} \left(\frac{N}{e}\right)^N \left(1 + \Theta\left(\frac{1}{N}\right)\right),$$

$$\lg(N!) \in 1/2(\lg 2\pi + \lg N) + N \lg N - N \lg e + \lg\left(1 + \Theta\left(\frac{1}{N}\right)\right)$$

$$= \Theta(N \lg N)$$

- This tells us that  $k$ , the worst-case number of tests needed to sort  $N$  items by comparison sorting, is in  $\Omega(N \lg N)$ : there must be cases where we need (some multiple of)  $N \lg N$  comparisons to sort  $N$  things.

CS61B: Lecture #29 3

## Beyond Comparison: Distribution

- But suppose can do more than compare keys?
- For example, how can we sort a set of  $N$  integer keys whose values range from 0 to  $kN$ , for some small constant  $k$ ?
- One technique: put the integers into  $N$  buckets, with an integer  $p$  going to bucket  $\lfloor p/k \rfloor$ .
- At most  $k$  keys per bucket, so concatenate and use insertion sort, which will now be fast.
- E.g.,  $k = 2, N = 10$ :

Start:

14 3 10 13 4 2 19 17 0 9

In buckets:

| 0 | 3 2 | 4 | | 9 | 10 | 13 | 14 | 17 | 19 |

- Now insertion sort is fast. Putting in buckets takes time  $\Theta(N)$ , and insertion sort takes  $\Theta(kN)$ . When  $k$  is fixed (constant), we have sorting in time  $\Theta(N)$ .

Last modified: Tue Jan 21 15:10:54 2020

CS61B: Lecture #29 4

## Distribution Counting

- Another technique: *count* the number of items  $< 1, < 2$ , etc.
- If  $M_p = \# \text{items with value } < p$ , then in sorted order, the  $j^{\text{th}}$  item with value  $p$  must be item  $\#M_p + j$ .
- Gives another *linear-time* algorithm.

Last modified: Tue Jan 21 15:10:54 2020

CS61B: Lecture #29 5

## Distribution Counting Example

- Suppose all items are between 0 and 9 as in this example:

7 0 4 0 9 1 9 1 9 5 3 7 3 1 6 7 4 2 0 0

3	3	1	2	2	1	1	3	0	3
0	1	2	3	4	5	6	7	8	9

Counts

0	3	6	7	9	11	12	13	16	16
< 0	< 1	< 2	< 3	< 4	< 5	< 6	< 7	< 8	< 9

Running sum

0	0	0	1	1	1	2	3	3	4	4	5	6	7	7	7	9	9	9
0			3			6			9		11	12	13			16		

- "Counts" line gives # occurrences of each key.
- "Running sum" gives cumulative count of keys  $<$  each value...
- ... which tells us where to put each key:
- The first instance of key  $k$  goes into slot  $m$ , where  $m$  is the number of key instances that are  $< k$ .

## Radix Sort

**Idea:** Sort keys *one character at a time*.

- Can use distribution counting for each digit.
- Can work either right to left (LSD radix sort) or left to right (MSD radix sort)
- LSD radix sort is venerable: used for punched cards.

Initial: set, cat, cad, con, bat, can, be, let, bet

*Pass 1 (by char #2)*

be	cad	can	con	bet	let	bat	cat	set
////	////	////	////	////	////	////	////	////
'u'	'd'	'n'	't'					

be, cad, con, can, set, cat, bat, let, bet

*Pass 2 (by char #1)*

bat	bet	cad	can	con	cat	can	bet	set
////	////	////	////	////	////	////	////	////
'a'	'e'	'o'						

cad, can, cat, bat, be, set, let, bet, con

*Pass 3 (by char #0)*

con	cat	can	con	bet	let	set	bat	be
////	////	////	////	////	////	////	////	////
'b'	'c'	'l'	's'					

bat, be, bet, cad, can, cat, con, let, set

## MSD Radix Sort

- A bit more complicated: must keep lists from each step separate
- But, can stop processing 1-element lists

A	posn
* set, cat, cad, con, bat, can, be, let, bet	0
* bat, be, bet / cat, cad, con, can / let / set	1
bat / * be, bet / cat, cad, con, can / let / set	2
bat / be / bet / * cat, cad, con, can / let / set	1
bat / be / bet / * cat, cad, can / con / let / set	2
bat / be / bet / cad / can / cat / con / let / set

## Performance of Radix Sort

- Radix sort takes  $\Theta(B)$  time where  $B$  is *total size of the key data*.
- Have measured other sorts as function of #records.
- How to compare?
- To have  $N$  different records, must have keys at least  $\Theta(\lg N)$  long [why?]
- Furthermore, comparison actually takes time  $\Theta(K)$  where  $K$  is size of key in worst case [why?]
- So  $N \lg N$  comparisons really means  $N(\lg N)^2$  operations.
- While radix sort would take  $B = N \lg N$  time with minimal-length keys.
- On the other hand, must work to get good constant factors with radix sort.

## And Don't Forget Search Trees

**Idea:** A search tree is in sorted order, when read in inorder.

- Need *balance* to really use for sorting [next topic].
- Given balance, same performance as heapsort:  $N$  insertions in time  $\lg N$  each, plus  $\Theta(N)$  to traverse, gives

$$\Theta(N + N \lg N) = \Theta(N \lg N)$$

## Summary

- **Insertion sort:**  $\Theta(Nk)$  comparisons and moves, where  $k$  is maximum amount data is displaced from final position.
  - Good for small datasets or almost ordered data sets.
- **Quicksort:**  $\Theta(N \lg N)$  with good constant factor if data is not pathological. Worst case  $O(N^2)$ .
- **Merge sort:**  $\Theta(N \lg N)$  guaranteed. Good for external sorting.
- **Heapsort, treesort with guaranteed balance:**  $\Theta(N \lg N)$  guaranteed.
- **Radix sort, distribution sort:**  $\Theta(B)$  (number of bytes). Also good for external sorting.
