# Welcome to CS61B!

- Sign up for a lab and discussion section using the SignUpGenius poll, available from the course website. If you can't find a slot, attend any section you can (although you have second priority for seating).
- Labs start today. In (or preferably before) lab this week, get a CS61B Unix account from https://inst.eecs.berkeley.edu/webacct.
- Because labs will be crowded, you might want to bring your laptop.
- ullet If you plan to work from home, try logging in remotely to one of the instructional servers (... @X.cs.berkeley.edu, where X is ashby, derby, cedar, gilman, oxford, or solano).
- We'll be using Piazza for notices, on-line discussions, questions.
- General information about the course is on the home page (grading, lateness, cheating policy, etc.).
- Concurrent enrollment students will be processed later.
- Lectures will be screencast.

CS61B: Lecture #1 1

#### Crowding

- If you choose not to take this course please drop it as soon as possible for the benefit of others (the add/drop deadline is 18 September—6 September if you wish to avoid a fee).
- Starting Monday, lectures are in Wheeler. As this won't even hold half of us. feel free to watch Webcasts instead.

#### **Texts**

- There are two readers currently on-line (see the website).
- You could do without printed versions, but might want to print out selected portions for exams (since we don't allow computers in tests).
- Textbook (for first part of the course only) is Head First Java. It's kind of silly, but has the necessary material.

# Course Organization I

- You read; we illustrate.
- Labs are important: exercise of programming principles as well as practical dirty details go there. Generally we will give you homework points for doing them.
- Homework is important, but really not graded: use it as you see fit
  and turn it in! You get points for just putting some reasonable effort
  into it
- Individual projects are *really* important! Expect to learn a lot. Projects are *not* team efforts (that's for later courses).

 Last modified: Wed Jan 22 14:20:54 2020 CS61B: Lecture #1 4

# Course Organization II

- Use of tools *is* part of the course. Programming takes place in a *programming environment:* 
  - Handles editing, debugging, compilation, archiving versions.
  - Personally, I keep it simple: Emacs + gjdb + make + git, (documented in one of the readers and on-line). But we'll look at IntelliJ in lab.
- Tests are challenging: better to stay on top than to cram.
- Tests, 40%; Projects, 50%; HW, 10%
- Stressed? Tell us!

### Programming, not Java

- Here, we learn programming, not Java (or Unix, or Windows, or...)
- Programming principles span many languages
  - Look for connections.
  - Syntax (x+y vs. (+ x y)) is superficial.
  - Java, Python, and Scheme have a lot in common.
- Whether you use GUIs, text interfaces, or embedded systems, important ideas are the same.

CS61B: Lecture #1 6

#### For next time

- Please read Chapter 1 of Head First Java, plus §1.1–1.9 of the on-line book A Java Reference, available on the class website.
- This is an overview of most of Java's features.
- We'll start looking at examples on Friday.
- Always remember the questions that come up when you read something we assign:
  - Who knows? We might have made a mistake.
  - Feel free to ask at the start of lectures, by email, or by Piazza.

## A Quick Tour through the First Program

```
In Python, we would write
```

Last modified: Wed Jan 22 14:20:54 2020

CS61B: Lecture #1 9

CS61B: Lecture #1 11

## Commentary

- Java comments can either start with '//' and go to the end of the line (like '#' in Python), or they can extend over any number of lines, bracketed by '/\*' and '\*/'.
- I don't use the '//' comments, except for things that are supposed to be replaced, and our style checks will flag them.
- The second, multiline kind of comment includes those that start with '/\*\*', which are called *documentation comments* or *doc comments*.
- Documentation comments are just comments, having no effect, but various tools interpret them as providing documentation for the things that follow them. They're generally a good idea and our style checks require them.

CS61B: Lecture #1 10

### Classes

- $\bullet$  Every function and variable in Java is contained in some  $\emph{class}.$
- These are like Python's classes, but with (of course) numerous differences in detail.
- All classes, in turn, belong to some package. The Hello class belongs to the anonymous package.
- We'll see named packages later,

### Methods (Functions)

- Function headers in Java contain more information than those in Python. They specify the *types* of values *returned* by the function and taken as *parameters* to the functions.
- The "type" void has no possible values; the main function here returns nothing. The type String is like Python's str. The trailing '[]' means array of. Arrays are like Python lists, except that their size is fixed once created.
- Hence, main takes a list of strings and returns nothing.
- Functions named "main" and defined like the example about are special: they are what get called when one runs a Java program (in Python, the main function is essentially anonymous).

CS61B: Lecture #1 12

#### Selection

- $\bullet$  As in Python,  $\mathcal{E}.N$  means "the thing named N that is in or that applies to the thing identified (or computed) by  $\mathcal{E}.$  "
- Thus "System.out" means "the variable named 'out' that is found in the class named 'System'."
- Likewise, "System.out.println" means "the method named 'println' that applies to the object referenced by the value of variable 'System.out'."

Last modified: Wed Jan 22 14:20:54 2020

## Access

- Every declared entity in Java has access permissions indicating what pieces of code may mention it.
- In particular, *public* classes, methods, and variables may be referred to anywhere else in the program.
- We sometimes refer to them as exported from their class (for methods or varialbles) or package (for classes).

Last modified: Wed Jan 22 14:20:54 2020

CS61B: Lecture #1 14

#### Access

- Static methods and variables are "one-of" things.
- A static method is just like an ordinary Python function (outside of any class) or a function in a Python class that is annotated @staticmethod.
- A static variable is like a Python variable defined outside of any class or a variable selected from a class, as opposed to from a class instance
- Other variables are local variables (in functions) or instance variables (in classes), and these are as in Python.
