#### CS61B Lecture #26

#### Today:

- Sorting algorithms: why?
- Insertion Sort.
- Inversions

## Purposes of Sorting

- Sorting supports searching
- Binary search standard example
- Also supports other kinds of search:
  - Are there two equal items in this set?
  - Are there two items in this set that both have the same value for property X?
  - What are my nearest neighbors?
- Used in numerous unexpected algorithms, such as convex hull (smallest convex polygon enclosing set of points).

#### Some Definitions

- A sorting algorithm (or sort) permutes (re-arranges) a sequence of elements to brings them into order, according to some total order.
- A total order,  $\leq$ , is:
  - Total:  $x \leq y$  or  $y \leq x$  for all x, y.
  - Reflexive:  $x \leq x$ ;
  - Antisymmetric:  $x \leq y$  and  $y \leq x$  iff x = y.
  - Transitive:  $x \leq y$  and  $y \leq z$  implies  $x \leq z$ .
- However, our orderings may treat unequal items as equivalent:
  - E.g., there can be two dictionary definitions for the same word. If we sort only by the word being defined (ignoring the definition), then sorting could put either entry first.
  - A sort that does not change the relative order of equivalent entries (compared to the input) is called stable.

#### Classifications

- Internal sorts keep all data in primary memory.
- External sorts process large amounts of data in batches, keeping what won't fit in secondary storage (in the old days, tapes).
- Comparison-based sorting assumes only thing we know about keys is their order.
- Radix sorting uses more information about key structure.
- Insertion sorting works by repeatedly inserting items at their appropriate positions in the sorted sequence being constructed.
- Selection sorting works by repeatedly selecting the next larger (smaller) item in order and adding it to one end of the sorted sequence being constructed.

## Sorting Arrays of Primitive Types in the Java Library

- The java library provides static methods to sort arrays in the class java.util.Arrays.
- For each primitive type P other than boolean, there are

```
/** Sort all elements of ARR into non-descending order. */
static void sort(P[] arr) { ... }
/** Sort elements FIRST .. END-1 of ARR into non-descending
* order. */
static void sort(P[] arr, int first, int end) { ... }
/** Sort all elements of ARR into non-descending order,
* possibly using multiprocessing for speed. */
static void parallelSort(P[] arr) { ... }
/** Sort elements FIRST .. END-1 of ARR into non-descending
* order, possibly using multiprocessing for speed. */
static void parallelSort(P[] arr, int first, int end) {...}
```

## Sorting Arrays of Reference Types in the Java Library

• For reference types, C, that have a natural order (that is, that implement java.lang.Comparable), we have four analogous methods (one-argument sort, three-argument sort, and two parallelSort methods):

```
/** Sort all elements of ARR stably into non-descending
 * order. */
static <C extends Comparable<? super C>> sort(C[] arr) {...}
etc.
```

And for all reference types, R, we have four more:

```
/** Sort all elements of ARR stably into non-descending order
    according to the ordering defined by COMP. */
static <R> void sort(R[] arr, Comparator<? super R> comp) {...}
etc.
```

• Q: Why the fancy generic arguments?

## Sorting Arrays of Reference Types in the Java Library

• For reference types, C, that have a natural order (that is, that implement java.lang.Comparable), we have four analogous methods (one-argument sort, three-argument sort, and two parallelSort methods):

```
/** Sort all elements of ARR stably into non-descending
 * order. */
static <C extends Comparable<? super C>> sort(C[] arr) {...}
etc.
```

And for all reference types, R, we have four more:

```
/** Sort all elements of ARR stably into non-descending order
   according to the ordering defined by COMP. */
static <R> void sort(R[] arr, Comparator<? super R> comp) {...}
etc.
```

- Q: Why the fancy generic arguments?
- A: We want to allow types that have compareTo methods that apply also to more general types.

## Sorting Lists in the Java Library

• The class java.util.Collections contains two methods similar to the sorting methods for arrays of reference types:

```
/** Sort all elements of LST stably into non-descending
 * order. */
static <C extends Comparable<? super C>> sort(List<C> lst) {...}
etc.
/** Sort all elements of LST stably into non-descending
   order according to the ordering defined by COMP. */
static <R> void sort(List<R> , Comparator<? super R> comp) {...}
etc.
```

Also an instance method in the List<R> interface itself:

```
/** Sort all elements of LST stably into non-descending
 * order according to the ordering defined by COMP. */
void sort(Comparator<? super R> comp) {...}
```

## Examples

• Assume:

```
import static java.util.Arrays.*;
import static java.util.Collections.*;
```

• Sort X, a String[] or List<String>, into non-descending order:

```
sort(X); // or ...
```

• Sort X into reverse order (Java 8):

```
sort(X, (String x, String y) -> { return y.compareTo(x); });
// or
sort(X, Collections.reverseOrder()); // or
X.sort(Collections.reverseOrder()); // for X a List
```

- Sort X[10], ..., X[100] in array or List X (rest unchanged): sort(X, 10, 101);
- ullet Sort L[10], ..., L[100] in list L (rest unchanged):

```
sort(L.sublist(10, 101));
```

## Sorting by Insertion

- Simple idea:
  - starting with empty sequence of outputs.
  - add each item from input, inserting into output sequence at right point.
- Very simple, good for small sets of data.
- With vector or linked list, time for find + insert of one item is at worst  $\Theta(k)$ , where k is # of outputs so far.
- ullet This gives us a  $\Theta(N^2)$  algorithm (worst case as usual).
- Can we say more?

#### **Inversions**

- ullet Can run in  $\Theta(N)$  comparisons if already sorted.
- Consider a typical implementation for arrays:

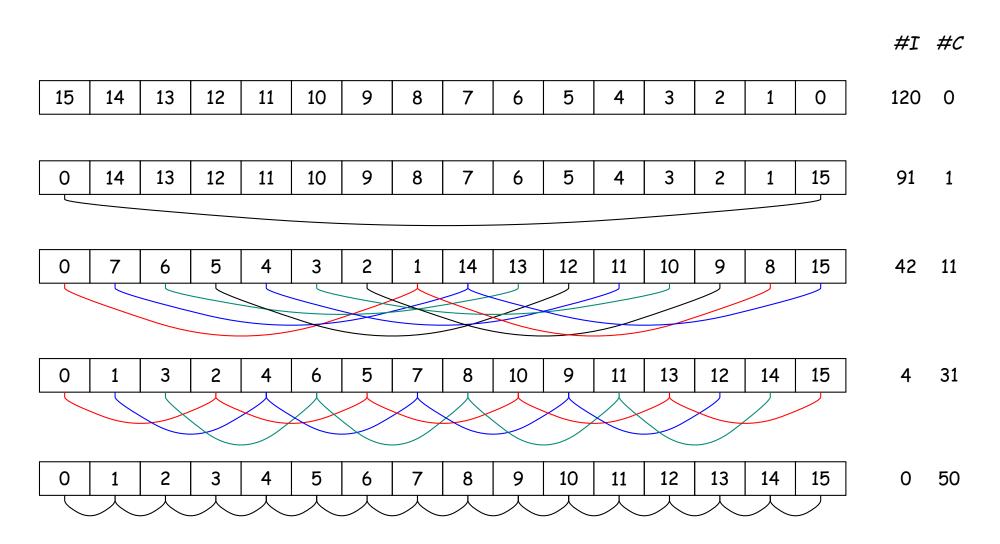

- $\bullet$  #times (1) executes for each  $j \approx$  how far x must move.
- ullet If all items within K of proper places, then takes O(KN) operations.
- Thus good for any amount of nearly sorted data.
- ullet One measure of unsortedness: # of inversions: pairs that are out of order (= 0 when sorted, N(N-1)/2 when reversed).
- Each execution of (2) decreases inversions by 1.

#### Shell's sort

Improve insertion sort by first sorting distant elements: Idea:

- First sort subsequences of elements  $2^k 1$  apart:
  - sort items #0,  $2^k 1$ ,  $2(2^k 1)$ ,  $3(2^k 1)$ , ..., then
  - sort items #1,  $1+2^k-1$ ,  $1+2(2^k-1)$ ,  $1+3(2^k-1)$ , ..., then
  - sort items #2,  $2+2^k-1$ ,  $2+2(2^k-1)$ ,  $2+3(2^k-1)$ , ..., then
  - etc.
  - sort items  $\#2^k-2$ ,  $2(2^k-1)-1$ ,  $3(2^k-1)-1$ , ...,
  - Each time an item moves, can reduce #inversions by as much as  $2^k + 1$ .
- Now sort subsequences of elements  $2^{k-1}-1$  apart:
  - sort items #0,  $2^{k-1}-1$ ,  $2(2^{k-1}-1)$ ,  $3(2^{k-1}-1)$ , ..., then
  - sort items #1,  $1 + 2^{k-1} 1$ ,  $1 + 2(2^{k-1} 1)$ ,  $1 + 3(2^{k-1} 1)$ , ....
  - -:
- End at plain insertion sort ( $2^0 = 1$  apart), but with most inversions gone.
- Sort is  $\Theta(N^{3/2})$  (take CS170 for why!).

# Example of Shell's Sort

I: Inversions left.

C: Cumulative comparisons used to sort subsequences by insertion sort.
